

Abstract of the Disclosure

A wheel-balancing weight mounts to a wheel with a flange. The weight has a weighted body and a clip securely attached thereto. The body defines a recess therein, and the clip has a securing portion formed to be securely positioned within the recess defined in the body and a grasping portion for securely grasping the flange. The recess of the body allows the clip to be axially positioned with respect to such body so that the body is axially shifted toward the mounted-to wheel to achieve a proper fit to the wheel. The securing portion of the clip is secured within the recess by forcing a portion of the body adjacent such clip into contact therewith.
